Activity 06 - Build a Data Quality and Feature Pipeline

Course: Google Professional Machine Learning Engineer Training Course code: C740 Version: v2.0 | 12 September 2026 Evidence: activity artifacts

Objective

Validate schema, repair missing values, encode features and preserve a training manifest.

Deliverables

- transactions.csv
- build_features.py
- feature_schema.json
- A completed evidence/ folder with decision notes and verification output

Prerequisites

- Python 3.11 or later and a terminal; Docker only where the activity explicitly uses it.
- For optional live Google Cloud steps: the safe training project created in Activity 01.
- Start in this activity folder so relative paths and cleanup commands remain scoped.

Safety, cost and privacy

- Use a training project that contains no production or personal data.
- Replace every placeholder such as <PROJECT_ID> and <REGION> before a cloud command.
- Do not paste API keys or service-account JSON into notebooks, scripts or screenshots.
- Prefer Cloud Shell and Application Default Credentials. Never commit .env or credentials.
- Verify the result against the acceptance checklist, then run the cleanup section.

Evidence to retain

Create an evidence/ folder locally. Save command output, job or revision IDs, metric tables, screenshots without secrets, and a short decision note. Use filenames that include the activity number and date. Evidence is part of the learning outcome, not an optional extra.

Detailed step-by-step guide

Step 1 - Profile transactions.csv for types, nulls, duplicates, impossible values and label balance

Profile transactions.csv for types, nulls, duplicates, impossible values and label balance.

```
python3 build_features.py --input transactions.csv --profile-only
```

Check: Record the observable result or explain the error before continuing.

Step 2 - Read feature_schema.json and confirm each field's type, allowed range and missing-value policy

Read feature_schema.json and confirm each field's type, allowed range and missing-value policy.

Check: Record the observable result or explain the error before continuing.

Step 3 - Run the feature builder to create a deterministic train/validation/test split and manifest

Run the feature builder to create a deterministic train/validation/test split and manifest.

```
python3 build_features.py --input transactions.csv --out-dir output
```

Check: Record the observable result or explain the error before continuing.

Step 4 - Inspect the rejected-row report

Inspect the rejected-row report. Correct source data rules rather than silently dropping all failures.

Check: Record the observable result or explain the error before continuing.

Step 5 - Check that category encoding handles unknown values and that fitted statistics use training rows only

Check that category encoding handles unknown values and that fitted statistics use training rows only.

Check: Record the observable result or explain the error before continuing.

Step 6 - Verify entity IDs do not appear as predictive numeric features

Verify entity IDs do not appear as predictive numeric features.

Check: Record the observable result or explain the error before continuing.

Step 7 - Compare split timestamps and confirm no future event contributes to an earlier example

Compare split timestamps and confirm no future event contributes to an earlier example.

Check: Record the observable result or explain the error before continuing.

Step 8 - Record row-count reconciliation, schema signature and output checksums

Record row-count reconciliation, schema signature and output checksums.

Check: Record the observable result or explain the error before continuing.

Acceptance checklist

[ ] Every required artifact exists and opens without error.

[ ] Results are tied to the supplied mock data or an approved training project.

[ ] The conclusion cites metrics, IDs or command output rather than opinion alone.

[ ] No credentials, tokens, personal data or unredacted sensitive prompts are present.

[ ] Cleanup is completed or the retained resource is documented with an owner and expiry.

Troubleshooting

Symptom	Likely cause	Corrective action
403 PERMISSION_DENIED	API disabled, wrong project, or IAM role missing	Verify gcloud config get-value project, API state and the least-privilege role.
429 RESOURCE_EXHAUSTED	Quota or rate limit reached	Stop retries, inspect quota, add exponential backoff, and ask the trainer before increasing quota.
Region/location mismatch	Dataset, bucket, model or endpoint uses another location	Recreate only the training resource in one approved region; do not copy sensitive data casually.
Result differs from expected	Data, dependency or configuration version drifted	Compare file hashes, pinned versions and parameters; retain the diff as evidence.

Cleanup

Stop local processes and remove only resources created for this activity. For live cloud work, use the Console resource views and activity evidence to verify deletion. Do not delete a shared project, dataset, bucket, registry or endpoint unless the trainer identifies it as disposable.
